# Vehicle Thermal Management - a Rough Definition

---

„Vehicle Thermal Management“ means „supply or extract heat where needed“ while following these superior objectives:

**High Thermal Reliability**

**Low Fuel Consumption**

**Low Emissions**

**High Thermal Comfort**

Additionally the Automotive Industry has some basic objectives:

**Short Development Time and Low Development Costs**

# Objective: High Thermal Reliability

**Golf I - 1974**

1.5 l, 51 kW, 1.0 t, ca. 150km/h

**Golf V - 2004**

2.0 l, 103 kW, 1.8 t, ca. 200 km/h

- top priority: safety of driver and car
- less clearance, less surrounding cooling air flow
- high heat releases (convection, radiation)
- high component temperatures
- complex systems
- complex interaction

# Objective: Low Fluid Consumption, Low Emissions

- fluid consumption measured by driving cycles
- in Europe: NEDC, 20min, 11 km, 20°C, AC „off“

- fossil resources getting shorter
- automotive industry has to comply with CO<sub>2</sub>-limits (e.g. 120 g/km in 2012)
- fuel costs rising
- „high emissions = high taxes“ ?

from: Süddeutsche Zeitung, 02/2007

# Objective: High Thermal Comfort

Temperaturen in einem Mittelklasse-PKW  
bei: Fahrzeit 1 h  
Außentemperatur 30 °C  
Sonneneinstrahlung auf den PKW

| Bereich | mit Klimaanlage | ohne Klimaanlage |
|---------|-----------------|------------------|
| Kopf    | 23 °C           | 42 °C            |
| Brust   | 24 °C           | 40 °C            |
| Fuß     | 28 °C           | 35 °C            |

from : SSP 208, „Klimaanlagen im Fahrzeug, Grundlagen“; Volkswagen AG

- passengers uncomfortable with heat ( $\Rightarrow$  cooling)
- passengers uncomfortable with cold ( $\Rightarrow$  heating)
- sensing „hot“ and „cold“ is relative
- „right“ climate improves safety
- standards for defrost, „pull-down“ test

from: „Flow inside Passenger Compartment“;  
Hoffmann, Fischer, Markowitz, Hupertz;  
Progress in Vehicle Aerodynamics IV, Stuttgart 2006

# Objective: Low Fluid Consumption + High Thermal Comfort

Dr. Christoph Lund / 1697

2007-05-22

| Fahrerinformationssysteme | Schaltpunktanzeige               |
|                           | Verbrauchs- / Effizienzanzeige   |

## Conflicting objectives

- engine cooling & aerodynamics
- high thermal comfort & low weight
- high thermal comfort & low fuel consumption
- high thermal reliability & tight package

## Future Innovations of German Automotive Industry

from: „CO<sub>2</sub>-Minderungen im Deutschen Verkehrssektor“, VDA, 2007; [www.vda.com](http://www.vda.com)

# Development Objectives: Low Costs & Short Time

- designing the heat exchangers
- designing the cooling systems
- selecting components
- rating variants
- checking / optimization
- designing control systems
- ... etc.

***Simulate!***

- ... as early as possible
- ... supporting / backing up development
- ... with neutral evaluation
- ... close / near to experiment

# Contents

---

## 1. Vehicle Thermal Management

## 2. Creative Ideas

## 3. Simulation Tools

## 4. Challenges

## 5. Summary and Outlook

## 2. Creative Ideas

### Minimize Energy Demands

- reduce pressure losses in coolant
- reduce pressure losses in cooling air
- avoid leakage of cooling air
- switch off pumps (water, oil, ...) & fans
- close cooling air path

### Minimize Energy Removal

- use radiator shutter
- use isolation / encapsulation
- use exhaust gas enthalpy
- check fan control

### Increase Energy Supply

- change combustion
- use PTC-elements
- use heat from exhaust gas

*lower fuel consumption  
+  
higher thermal comfort*

### Change Thermal Masses

- reduce fluid volume (water, oil)
- use heat storage
- use new materials (heat capacity)

### Change Heat Distribution

- change volume flow rate
- use electrical water pump
- use electrical oil pump
- change oil temperature level
- use more than one in-engine coolant flow
- use separate control for separate systems

# Creative Ideas (many more available)

| Idea                           | Potential Fuel Savings in NEDC | Comment                             |
|--------------------------------|--------------------------------|-------------------------------------|
| Electrical Water Pump          | 1.5% ... 2-0%                  | New Coolant Pipes Necessary!        |
| Engine Encapsulation           | 0.5% ... 1.0%                  | Weight, Temperatures, Assembly?     |
| Increased Gear Oil Temperature | 0.5 ... 1.0%                   | ATF-Cooler Necessary?               |
| Radiator Shutter               | < 0.5%                         | 2% in $c_w$                         |
| Volume-Flow Control (Oil Pump) | 1.4 ... 2.4%                   | Control Algorithm?                  |
| Oil Volume 50% reduced         | 1.2%                           |                                     |
| Adaptive Thermal Management    | 0.5 ... 1.0%                   |                                     |
| <b>Total Potential = Sum ?</b> | <b>? %</b>                     | <b>“summing-up” not realistic !</b> |

Data from: „Wärmemanagement des Kraftfahrzeugs“, HdT Essen, 1998-2006 (various authors)

## Typical Problems

- Individual Actions Affect Each Other – Complex Interactions!
- Accuracy of Measurement  $\approx$  Potential of Individual Actions

**Need Information  
about all systems!**

**Simulate!**

**3. Simulation Tools**

**4. Challenges**

**5. Summary and Outlook**

# 1D: Simulating Cooling Air Flow

Dr. Christoph Lund / 1697

heat exchangers

fans

- cooling air mass flow
- component selection (grill, fans, heat exchangers)
- coupling to engine cooling system (e.g. water)

cp-values  
& air inlets

pressure loss  
„engine block“

2007-05-22

Seite 14

# 1D: Simulating Cooling Systems (Water, Oil, ...)

- coolant mass flow
- pressure loss
- component selection (heat exchangers, pump, pipes)
- system behaviour

# 3D: Simulating the Underhood Flow

- detailed cooling air flow
- circulations, back flow, flow topology
- cooling air mass flows, flow onto the heat exchangers
- coupling to engine cooling system (e.g. water)
- heat transfer coefficients (component temperatures)

# 3D: Simulating Radiation / Component Temperatures

Temperatures along Exhaust System and Underbody

Catalyst – Normal and Thermographic Photo

- component surface temperatures
- component selection (e.g. heat shields)
- material selection
- underbody (exhaust heat)
- cabin (solar radiation)

# Simulation Tools

## Typical Applications

- cooling air flow
- cooling water flow
- coolant water jacket
- charge air system
- heat conduction
- aerodynamic forces
- component temperatures
- cabin air flow, solar radiation
- engine gas exchange
- driving performance
- aerodynamics
- ... and more

## Current Situation

- a lot of experience available
- many different targets
- many applications established
- many departments involved
- many similar sw tools available
- still many vehicle tests needed!

**Simulations mostly  
aimed at components  
or single systems**

# Note: „Ultimate Rating“ Requires A Complete Vehicle

# Contents

---

**1. Vehicle Thermal Management**

**2. Creative Ideas**

**3. Simulation Tools**

**4. Challenges**

**5. Summary and Outlook**

# Challenges

# Challenge: Thermal Comfort Evaluation

## Technical Difficulties

- „thermal comfort“ is relative
- absolute comfort rating difficult to test
- different test procedures

## Simulation Difficulties

- thermo-physiological model of human body
- comfort model giving both global and local „simple“ ratings
- coupling to AC and cabin heater
- CFD results of cabin model sensitive to turbulence model

pictures from: „Modernes Thermomanagement am Beispiel der Innenraumklimatisierung“; Schneider, Ellinger, Paulke, Wagner, Pastohr; ATZ 02 / 2007

# Challenge: Prediction of Transient Component Temperatures

## Simulation Difficulties

- problem is transient
- engine shut-off leads to very complex heat redistribution
- very complex interaction of conduction, convection and radiation
- time-dependent forced and later free convection
- difficult boundary and initial conditions
- not much experience with component models (DPF, catalyst, muffler)

from: „Underbody Temperature Simulations – are there Pitfalls?“, Herrera, Lund; 3rd RadTherm UGM, Stuttgart 2007

from: „Virtual Thermal Testing at Volvo Cars“, Maria Krantz; 2nd European RadTherm UGM, Stuttgart 2006

# Challenge: Thermal Engine Model

## Objectives

- fuel consumption
- heat flux to water, oil, ambient
- heat flux to exhaust
- friction
- warming up

Heat Input

FLOWMASTER 2004

„Deckel“

„Gehäuse“

„Öl“

nicht dargestellt: „Wasser“

KULI 2007

4 point masses mixing  
water / metal and oil / metal;  
automatic calibration

# Challenge: Thermal Engine Model

## Simulation Difficulties

- conflicting objectives: good prediction & easy calibration
- high number of point masses → better approximation
- high number of point masses → complicated calibration
- friction models complicated for oil temperatures  $< 40^{\circ}\text{C}$
- combustion models (e.g. Vibe) complicated for temperatures  $< 40^{\circ}\text{C}$
- engine on test rig  $\neq$  engine within car
- new engine control unit  $\Rightarrow$  new thermal engine model ?
- thermal engine model required by „car engineers“ – not by „motor engineers“
- „single point mass model“ much too simple – „engine gas exchange model“ much too complicated
- more than one engine model for a single engine necessary – details increasing with development time
- scaling of engine models needed to predict behaviour for e.g. higher cylinder capacity

# Challenge: Complete Thermal Vehicle Model

Dr. Christoph Lund / 1697

2007-05-22

Seite 26

## Vehicle Thermal Management - a Rough Definition

„Vehicle Thermal Management“ means „supply or extract heat where needed“ while following these superior objectives:

**High Thermal Reliability**

**Low Fuel Consumption**

**Low Emissions**

**High Thermal Comfort**

Additionally the Automotive Industry has some basic objectives:

Short Development Time and Low Development Costs

Entwicklung Aufbau  
Funktionsauslegung Ausstattung und  
Methoden, EKAB

Note: „Ultimate Rating“ Requires A Complete Vehicle

**Need to Simulate Thermal  
Behaviour of Complete Car!**

# A Thermal Model of a Car – the Basic Technique

from: Puntigam, Lang, Petutschnig, Almbauer, VDI-Bericht Nr. 1967, 2006

# A Thermal Model of a Car – the Situation in Industry

## Typical Sub-Systems

- cooling air
- cooling water
- engine oil
- gear oil
- charge air
- exhaust
- air conditioning
- engine
- gear box
- cabin
- driving
- engine control

## Typical Departments

- engine #1
- engine #2
- cooling #1
- cooling #1
- climate #1
- design #1
- car #1
- car #2
- electronics #1
- electronics #2
- testing #1
- testing #2

## Typical Software

How to build a model which is

- valid
- extensible
- transferable
- accepted

and at the same time cheap?

# Managing Complex Sub-Systems by Simulation

## Typical Physical Difficulties

- different time scales
- different signs (e.g. heat flow)
- many interactions
- complex initial conditions
- not everything is 1D
- complex control

## Typical Complex Simulations

- power plant simulator
- submarine simulator

### Main Difference to Automotive Sector:

- simulation companies use a single software (e.g. C++, FORTRAN + libraries)
- only a single department involved
- often the product already exists
  - the simulation is just a „simpler“ copy

## Automotive Sector

- the simulation is needed to design the product
- many different departments involved
- each department is responsible for 1 component / system

# Coupling of Software-Systems – 3 Basic Options

e.g. 4 sub systems

## Different tools for partial systems / sub-systems

- many interfaces, complex support
- complex handling & postprocessing

## Only a single tool for all systems

- simple interface, simple support
- easy to use, easy post-processing

option A: all departments accept and use a single tool

option B: a special team rebuilds all department models using a single software – while the other departments use many different software tools

## Different tools for partial systems, coupled by special / neutral coupling tool

- easy to use, easy support
- examples: EXCITE, MpCCI, vif, TISC, ...
- high potential - but no experience in industry!

# Building a Complete Thermal Model of a Car

# Challenges to Simulation

---

- simple, robust and reliable models; details increasing with development time
- thermal engine models with combustion and friction - even for cold start
- thermal gear box models – even for cold start
- thermal comfort models – reliable and robust
- evaluation of thermal operational behaviour of complete vehicles
  - using different software tools and including different departments
  - models depending on load, ambient data and time
  - models compute fuel consumption, „thermal comfort“ and energy balance
  - easy and direct link to experimental data
- automatic calibration of sub-systems and complete models
- easy data handling for complex models and their variants
- real time capability (or faster) for complete vehicle thermal model
- design of control systems, interface to engine control unit

# Contents

---

**1. Vehicle Thermal Management**

**2. Creative Ideas**

**3. Simulation Tools**

**4. Challenges**

**5. Summary and Outlook**

# Summary and Outlook

- The Thermal Management simulation focus widens ...  
... from single operating points to many o.p. to transient behaviour  
... from “component” to “system” to “car” to ... ?

- Simulation is the only way to really „manage“ Vehicle Thermal Management
- A “Complete Vehicle Thermal Model” is necessary and technically possible !

# Simulation within the Development Process

## - a “Traditional” Way

# System-Simulation within the Development Process

## - the Future Challenge

# Outlook – Vehicle Thermal Simulation in 5 Years ?

---

## Simulation Models

- simple, robust and flexible coupling
- supplier industry provides sub-models
- unique interface descriptions
- simple data handling
- “complete car models” are standard
- interface to engine / climate control
- simple interface between 1D and 3D

## Calibration Test for Simulation Models

- special standardized component tests
- special standardized engine tests
- special standardized car tests

## Simulation Results

- transient energy „distribution“
- thermal comfort; transient ?
- emissions ?

## Simulation Engineers

- experts for single systems
- experts for complete cars
- very, very friendly ☺

**Let's try it!**
